

Amendments to the Drawings:

Please replace drawing #4 with the following amended drawing #4. Copies of the original and the amended drawings are attached.

REMARKS/ARGUMENTS

The patent application is being amended to extend the range of applicability to address:

- a) Adult users while in a horizontal vs. vertical body position, and
- b) Children

Because the autonomic nervous system slows the intrinsic heart rate variability rhythm when one is horizontal vs. vertical, it is necessary to support breathing frequencies lower than the 0.085 reference frequency.

Also, because the intrinsic heart rate variability frequency changes with age, children below the age of 10, typically demonstrate intrinsic heart rate variability frequencies that are significantly faster than adults. Here it is necessary to support breathing frequencies higher than the 0.085 reference frequency.

The inventor asserts that these modifications are firmly within the context of the original intent and respectfully requests a timely Notice of Allowance be issued in this case. Thank you for your consideration of the matter.

Sincerely,

Stephen B. Elliott, Inventor
